

Archiving

Medirex can supply a complete archiving system. This would include point of creation scanners, signature pads, high speed back-end scanners, enterprise-wide document print capabilities, archive interface software, record management software, archive management software and hardware. With this complete suite of archive and document management products, Medirex can assist with your Electronic Patient Record strategy.

Archiving your documents can be accomplished in two ways. The first and most important is that any computer generated record can be automatically archived - and in the case of your patient registration process it becomes the beginning of the Electronic Patient Record. Secondly, handwritten records can be scanned and associated to the same electronic record. At point-of-form creation, a bar code is programmed as an index point for the scanning and archiving of the document. We have strongly suggested that even though some of our clients are not currently scanning their documents, that having the bar code on their print on demand forms will decrease the amount of money that will have to be spent when the forms are scanned at a future date. We can support a variety of bar code standards including "Code 3 of 9" and the 2 dimensional "PDF417". There is a range of features that can be implemented, to accomplish archiving of documents anywhere in the clinical & business process. We can phase in this technology focusing on the registration process, demonstrating the effectiveness of archiving.

The archiving process is completely automated, requiring no intervention from the user. Records that are created are grouped together, used, and added to in an ad hoc manner. Both paper and electronic forms can eventually be destroyed as per the legal or organizational rules
